SKA-VLBI overview

Paragi, SKA-VLBI KSP WS 2019

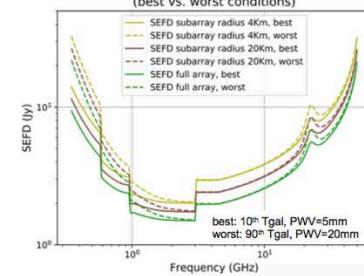

SKA-VLBI CONFIGURATIONS: networks & sensitivities

SKA1-MID

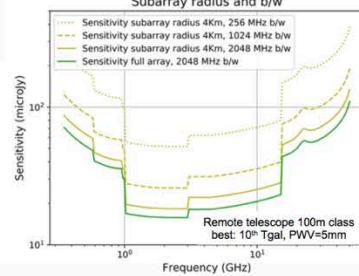

Examples of phased-up subarray radius

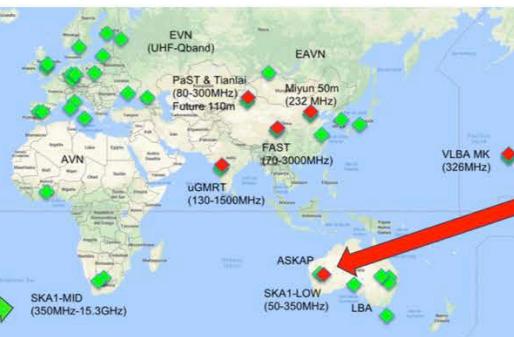

SEFD - SKA1-MID subarray radius (best vs. worst conditions)

SKA1-MID VLBI baseline sensitivity Subarray radius and b/w

VLBI-MID

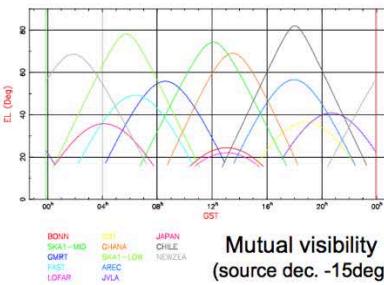

VLBI-LOW

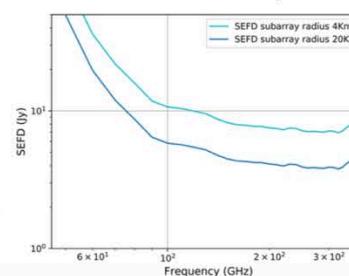

SKA1-LOW

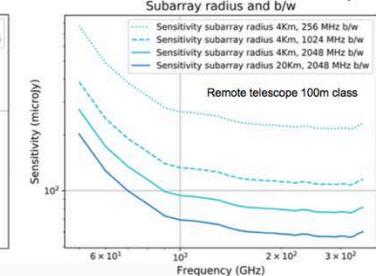

Examples of phased-up subarray radius

SEFD - SKA1-LOW subarray radius

SKA1-LOW VLBI baseline sensitivity Subarray radius and b/w

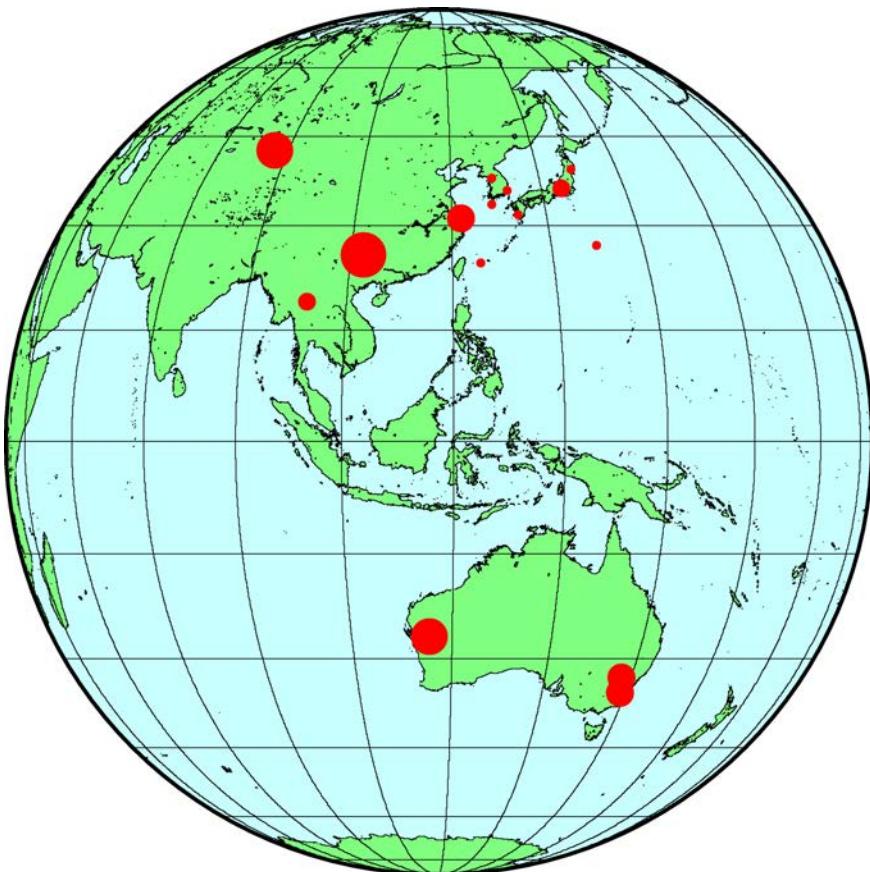

Access to Southern skies, (sub-)Jy sensitivity on mascales, superior calibration

Multi-beam capability: high-precision astrometry!

Simultaneous SKA products: range of angular scales, unique commensal applications

Ultimate *sensitivity* global VLBI

■ Possible collaboration for future global VLBI

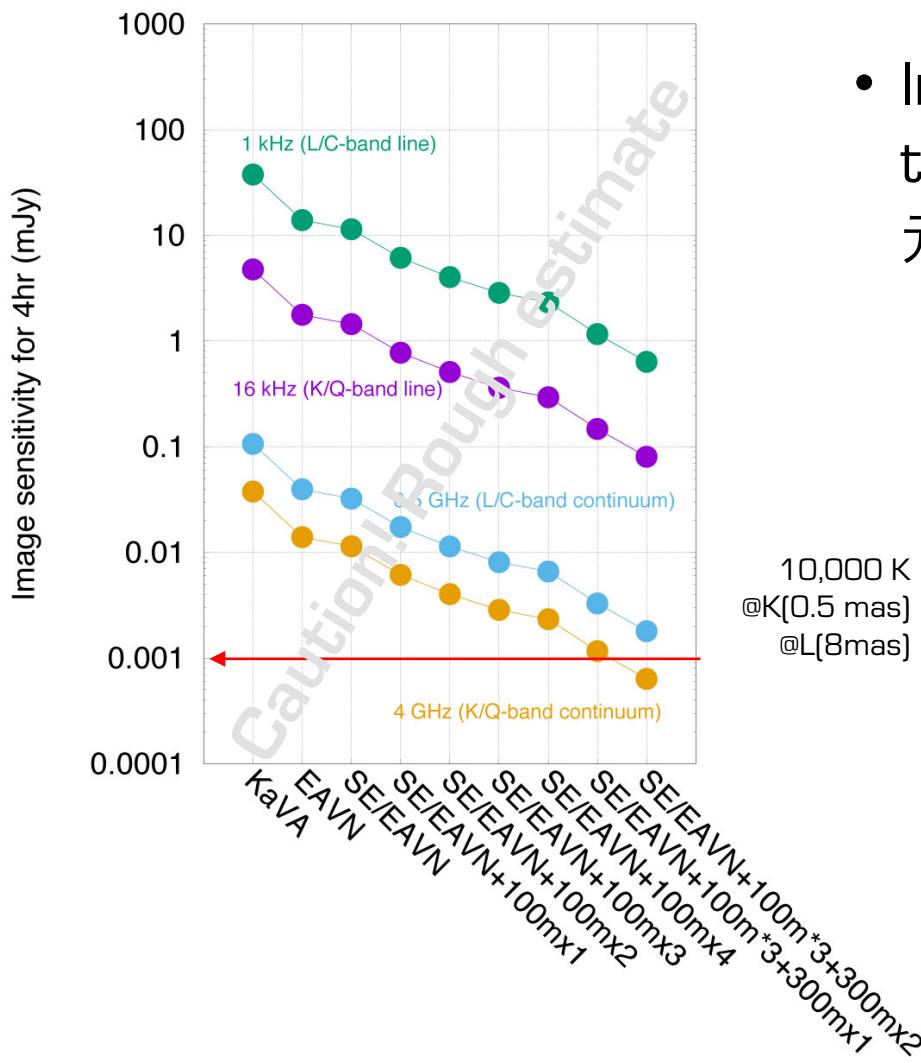

- Ultimate global VLBI with SKA1
 - Along with a few 100 m-class
 - Several 50 m-class
 - Many 20-30 m antennas

+Phased ALMA Band 1(0?)
+ngVLA LBA

- Common frequency?
- Common sky?
- Need more detailed study

Rough estimate of sensitivity

■ Improvement from KaVA by a factor of 100

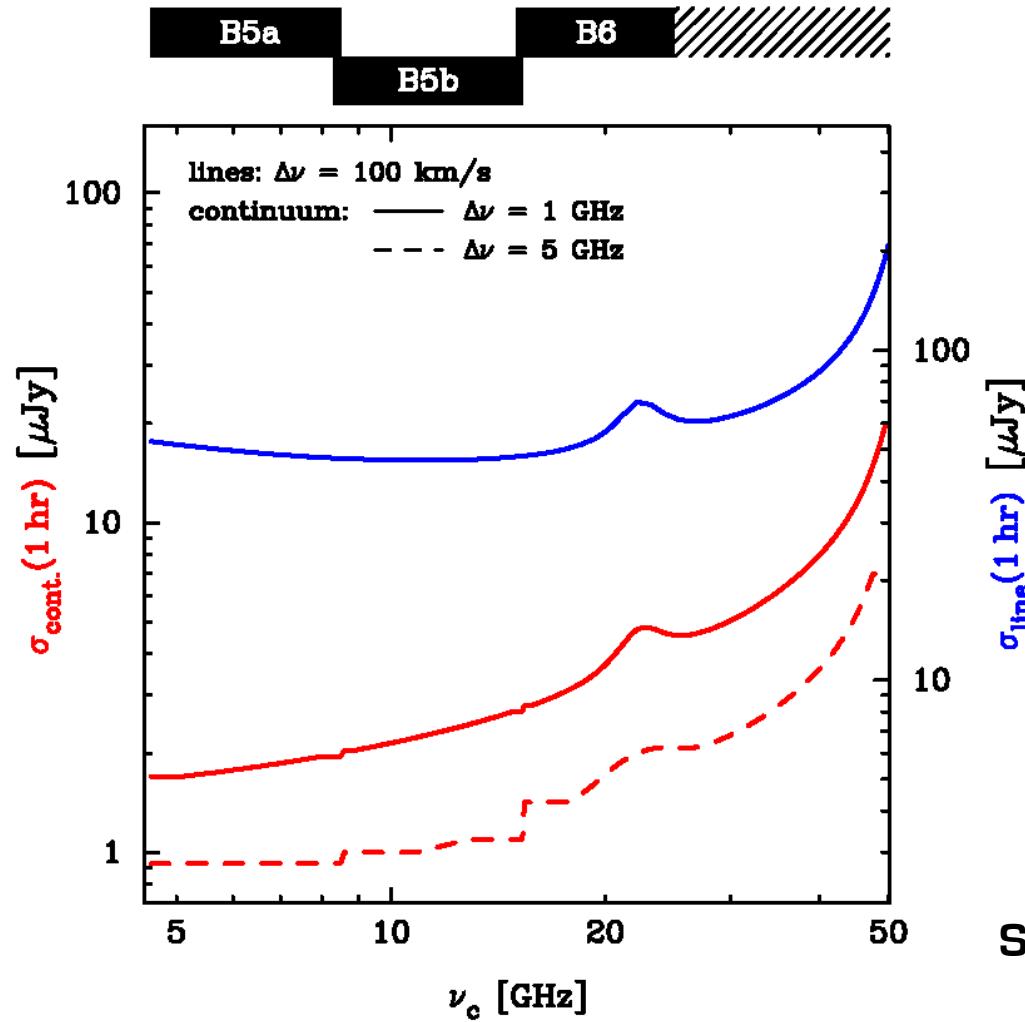

- Image sensitivity of 4hr on-source time (1σ) based on “SKA-VLBI 性能諸元(2020 September version)”

- Assuming $T_{\text{sys}}=100$ K and $e=50\%$ if there is no information
 - Rough estimate with uncertainties of a factor of 3-10

Ultimate *sensitivity* global VLBI

■ c.f. Image sensitivity at Bands 5 and 6

- Parameters are different from my rough estimate
- Still my rough estimate is comparable with that of SKA official document
 - Achieving μJy level

SKA Science book beyond band 5(2020)

SKA-VLBI science cases

Garcia-Miro, SKA-VLBI KSP WS 2019

VLBI with SKA1-MID:
6 science cases updated

SKA continuum surveys

- Adding high angular resolution to SKA surveys: Giroletti et al.
- Resolving ultra-relativistic outflows with SKA-VLBI: Paragi et al.
- Massive densification of the radio RF: searching for Gaia counterparts: Charlot et al.
- Galactic structure using maser parallax measurements: Ellingsen et al.
- Dynamics of the Galactic Bulge using OH masers: Imai et al.
- Young stellar cluster deep field: Hoare et al.

Exploring the Universe with the world's largest radio telescope

VLBI with SKA1-MID:
16 new science cases: Astrometry

High-precision astrometry

- High precision astrometry of continuum sources in star forming regions: Dzib et al.
- Ultra-precise astrometry to the MCs: Rioja et al.

Global astrometry

- Radio and Gaia reference frames tie with radio stars: Zhang et al.

Exploring the Universe with the world's largest radio telescope

VLBI with SKA1-MID:
16 new science cases: stars, planets, ISM

Radio emission from massive exoplanets: Gawronski et al.

Pulsar scintillometry with SKA1-MID: Kirsten et al.

Exploring the Universe with the world's largest radio telescope

VLBI with SKA1-MID:
16 new science cases: AGNs (1/2)

Deep multi-frequency Polarimetric survey of a big AGN sample: Agudo et al.

Extremely high-z AGNs: Perger et al.

Chasing merged and merging SMBH: Anton et al.

Exploring the Universe with the world's largest radio telescope

VLBI with SKA1-MID:
16 new science cases: AGNs (2/2)

Intermediate mass black holes: Mezcua et al.

Testing models of galaxy formation and dark matter with strong gravitational lensing: McKean et al.

Characterising feeding and feedback in high-z radio AGN using HI absorption: Morganti et al.

Exploring the Universe with the world's largest radio telescope

VLBI with SKA1-MID:
16 new science cases: Transients

FRBs and their hosts: Paragi et al.

ULXs in the local Universe: Middleton et al.

Inhomogeneous SNe at low freqs: Chandra et al.

Superaires on low-mass stars: Villadsen et al.

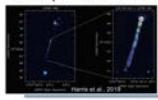

Exploring the Universe with the world's largest radio telescope

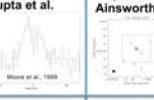

See presentation files in SKA VLBI KSP WS 2019

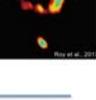

SKA-VLBI science cases

Garcia-Miro, SKA-VLBI KSP WS 2019

VLBI with SKA1-LOW:
7 new science cases

Galaxies and AGN
AGN physics at very low freqs: Morabito et al.

Transients
HI absorption at high z: Gupta et al.

Inhomogeneous SNe at low freqs: Chandrat et al.

Pulsars and ISM
Pulsar scintillometry at very low freqs: Kirsten et al.

Stars, Planets, Astrometry
Precise astrometry of low frequency pulsars: Dodson et al.

Precise astrometry for exoplanets detection: Guirado et al.

Maser sciences from VERA

■ Increased number of new rare/weak lines

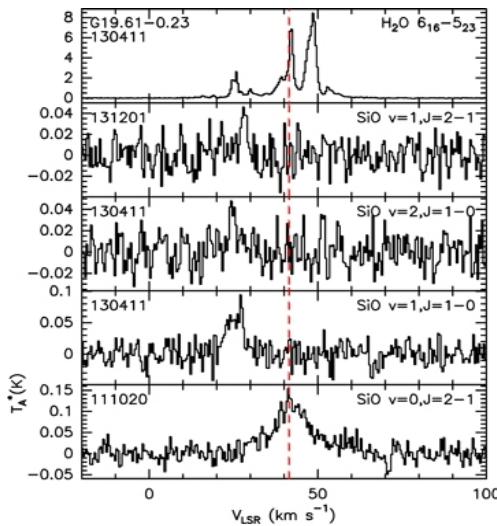

band	Range (GHz)	Species and line frequencies (GHz)	# lines
1	1.2 - 3.5	ground-state OH (1.612, 1.665, 1.667, 1.720)	4
2	3.5 - 12.3	excited OH (4.66, 4.75, 4.765, 6.031, 6.035, 6.049) CH_3OH Class I (9.936) CH_3OH Class II (6.668, 12.18) ortho- H_2CO (4.83)	6 1 2 1
3	12.3 - 20.5	CH_3OH Class II (19.97) excited OH (13.441, Baudry et al. 1981; Caswell 2004)	1 1
4	20.5 - 34	H_2O (22.235) CH_3OH J_2-J_1 -series Class I (24.9-30.3) CH_3OH Class I (23.445, Voronkov et al. 2011) CH_3OH Class II (23.12, Cragg et al. 2004) ortho- NH_3 (3,3) (6,6) (9,9) (12,12) other NH_3 inversion lines (thermal and/or maser) excited OH (23.8, Baudry et al. 1981)	1 15 1 1 1 4 ~dozen 1
5	30.5 - 50.5	Class I CH_3OH (36.169, 44.069) Class II CH_3OH (37.7, 38.29, 38.45) SiO 1-0 v=1,2 (43.12, 42.82)	2 3 2
6	70 - 116	CH_3OH Class I (84.521, 95.169, 104.3) CH_3OH Class II (76.2, 76.5, 85.5, 86.6, 104.1, 107, 108.8) SiO 2-1 v=1,2 (86.24, 85.64)	3 7 2

Maser sciences from VERA

■ Increased number of new rare/distant targets

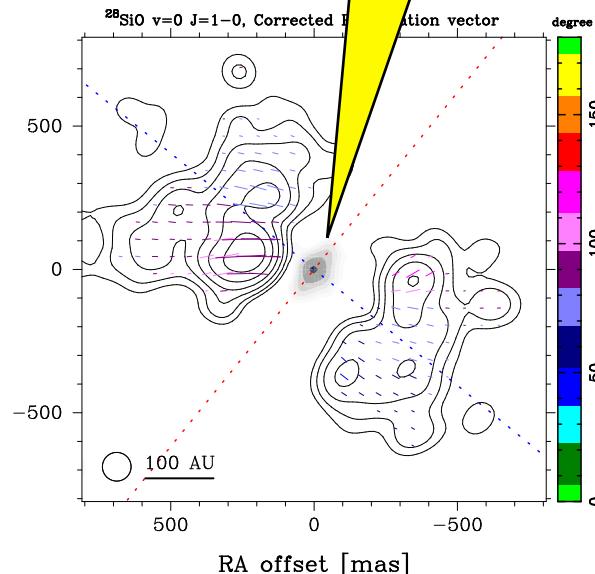

- SiO in SFRs
- Extra-galactic masers
- Polarization
- Combined with continuum

No radio jet?

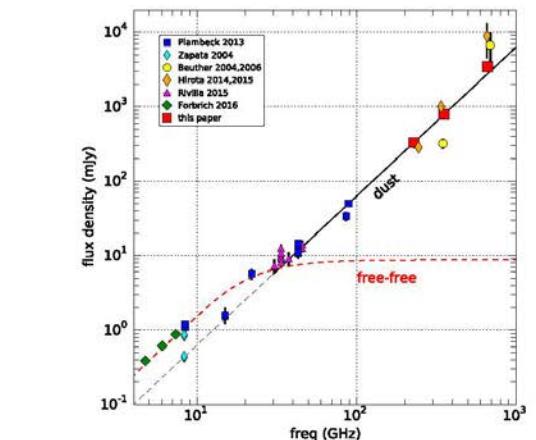

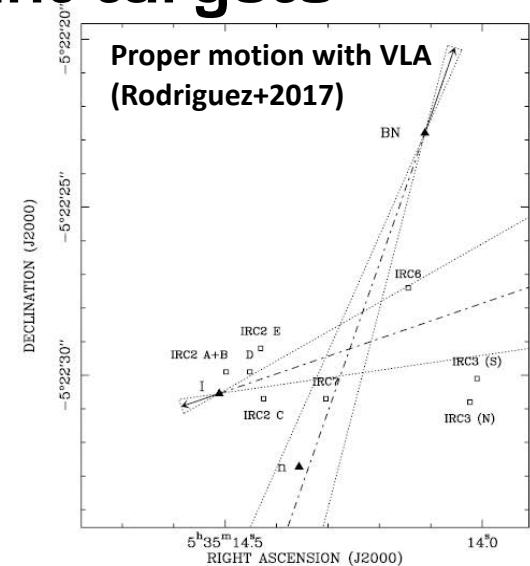

New SiO maser source G19.61-0.23 detected by ALMA (Cho et al. 2016)

DEC offset [mas]

Linear polarization of SiO v=0 J=1-0 maser with VLA (Hirota et al. 2020)

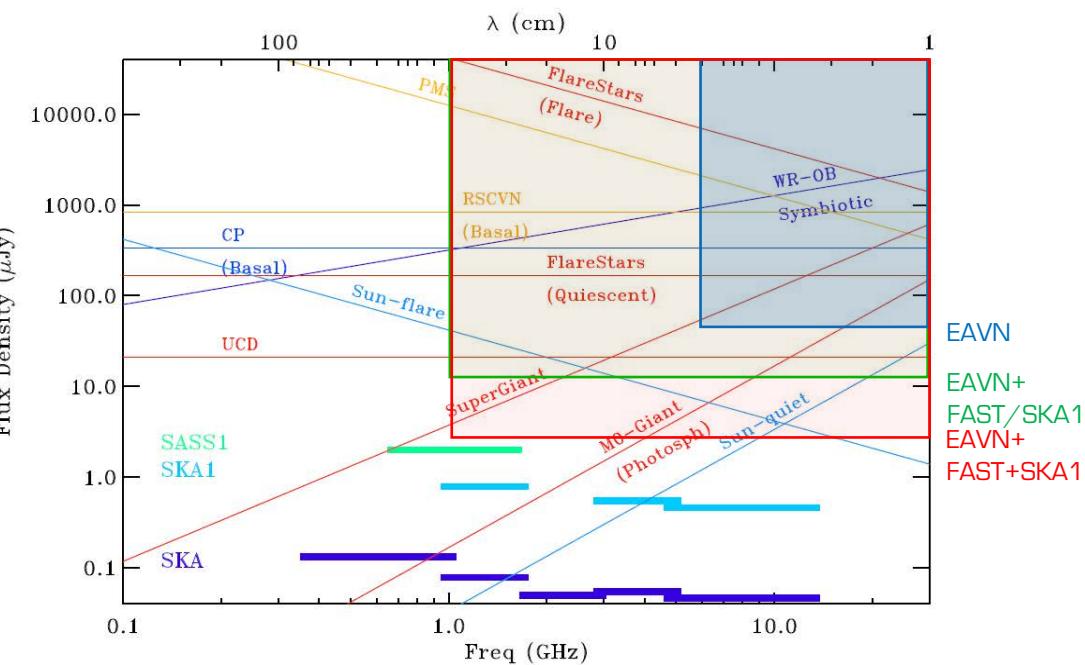

SED of Source I (Plambeck & Wright 2016)

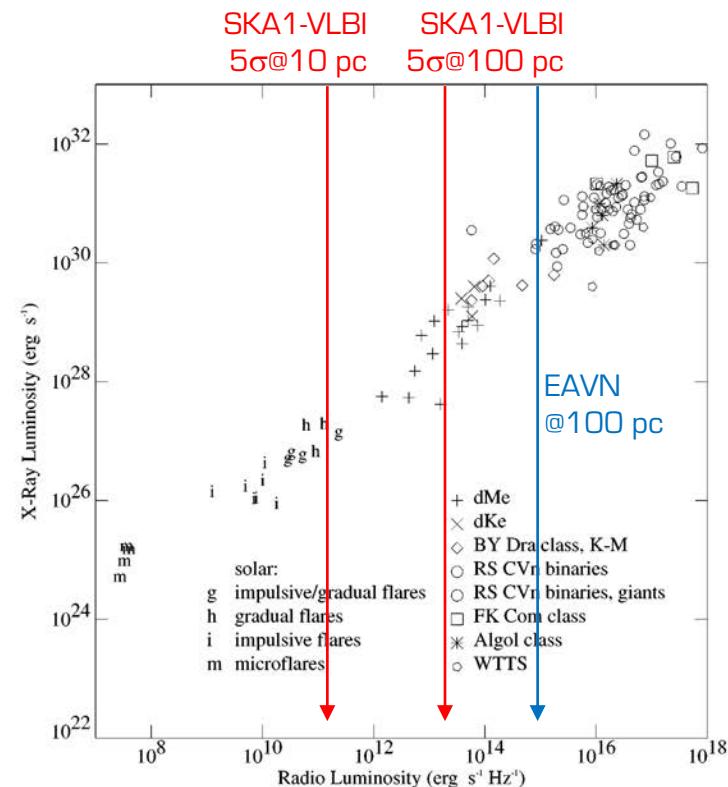

Targets of stellar radio emissions

■ Various classes of stars are possible targets

- Planets are also possible targets (mainly at SKA-Low)
- Non-thermal: good targets for VLBI
- Thermal: depending on size

Stellar radio spectra (Umana et al. 2015)

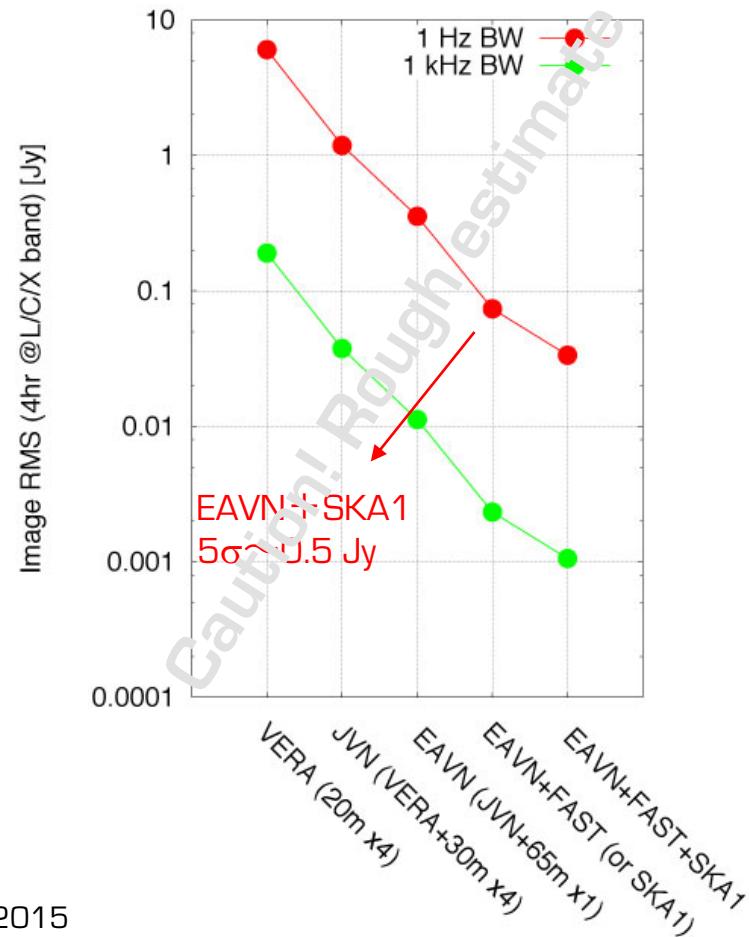

Relationship between X-ray and radio [5-8 GHz] luminosity (Gudel 2002)

Recent Unsuccess as Breakthrough Initiatives

- $F_v = 8 \times 10^{-16} \text{ EIRP}(D_{pc})^2 [\text{Jy}]$ for $\Delta v = 1 \text{ Hz}$
 - ✓ Nearby planets; EIRP < 5×10^{19} at L band by GBT (Enriquez+2017)
 - ✓ Survey in Orion; EIRP < 4×10^{20} at FM by MWA (Tingey+2018)
 - ✓ Oumuamua; EIRP < $7 \text{ kW} / 100 \text{ kW}$ (broad/narrow) (Tingey+2018)
- EAVN+SKA can detect airports?

Transmitter Type	Luminosity (EIRP) (ergs/sec)	Number on Earth
 Interplanetary Radar	$\sim 2 \times 10^{20}$	Few
 Long Range Aircraft Radar	$\sim 1 \times 10^{17}$	Dozens
 High Power TV and Radio	$\sim 5 \times 10^{12}$	Hundreds

Summary

■ **SKA-VLBI will provide μ Jy images at mas resolution**

- New science window will open
- Thermal emissions can be possible targets

■ **Collaboration with ALMA Band 1 (0?) and ngVLA will be essential to achieve ultimate sensitivity at currently available EAVN frequency bands**

■ **FAST, LOFAR, etc. will also be essential to achieve ultimate sensitivity at lower frequency (not discussed in this presentation, though)**
